

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

plants were inhabitants of swamps, and it is the author's belief that the toxic theory, which he has done so much to develop, explains these ancient xerophytic structures as well as it does the xerophytic structures of modern bog plants.—H. C. COWLES.

**Seedling anatomy.**—Miss THOMAS<sup>20</sup> has added a large body of facts to our knowledge of seedling anatomy, having investigated 150 species belonging to Ranales, Rhoeadales, and Rosales, about half of them belonging to Ranales. She has reached some interesting conclusions as to the phylogenetic relations of the various anatomical conditions, and is inclined to believe that seedling anatomy may be of service in indicating relationships, in spite of the recent tendency to discount it. It would be of interest if Miss THOMAS should "summarize or analyze" the results obtained thus far, and give us a profitable perspective.—J. M. C.

**Scinaia.**—SETCHELL<sup>21</sup> has studied the species of red algae which have usually passed for *Scinaia*. As a result he has broken up what seems to be a plexus of forms. After a description of the morphology of the group, the taxonomic presentation includes *Scinaia*, with 11 species, 5 of which are new; *Gloiocephloea*, with 7 species, 4 of which are new; and *Pseudoscinaia*, a new genus with two species. The discussion of geographical distribution of this group of forms is particularly suggestive, a subject to which the author has been giving much attention.—J. M. C.

**Mutation in Egyptian cotton.**—KEARNEY<sup>22</sup> has contributed to the literature of mutation by describing the behavior of Egyptian cotton, which exhibits the tendency characterizing *Oenothera Lamarckiana*, new characters appearing at different times and in different places. The origin of this cotton is obscure, but it seems certain that the varieties now grown are of mixed ancestry. If this be true, it would confirm the view that the tendency to produce mutants is a result of remote or complex hybridization.—J. M. C.

**Elementary species of Onagra.**—BARTLETT<sup>23</sup> has published 12 new elementary species of the subgenus *Onagra*, 5 of them belonging to the aggregate called *O. biennis* in our manuals, 2 of them being allies of *O. parviflora*, and the remaining 5 being included in the recent descriptions of *O. muricata*, which in
